

**FOR 240 Lab 1 - Assignment**  
**Creating Your Own Web Pages with HTML**  
Introduction to Computing in Natural Resources

In this lab, you need to use the hypertext markup language (HTML) to create your own web pages. While you are building the pages, the following items need to be considered:

- Starting page (index.html) with your personal information.
- One or more pages about this course or your study activities at WVU, which should be linked to the starting page.
- At least one image should be embedded on your page.
- You should try your best to use all the HTML tags or techniques you have learnt in the class, such as table and enlargement of an image.
- You also need to provide the links to some other web sites, such as the web site for this class, WVU Division of Forestry, WVU, and others.

You can first start to work on these pages on a local machine. Once they are done, you should copy them to a CD or a floppy diskette and then the files will be copied to an assigned directory for you on a specified web server. For more information about previous student projects, please visit <http://www.wdsc.caf.wvu.edu/jxwang/courses/for240/>.

Please provide me a typed summary report on how your web pages are created and a CD including all the HTML files and images by the beginning of the lab next week.
