## WDSC 422 Lab 2 - Assignment

Skidder Productivity Analysis
Harvesting Forest Products
Fall Semester, 2014

(Source: Phillips, A.P. 1983. Skidder load capacity and fuel consumption HP-41C program. United States Department of Agriculture, Forest Service, Northeastern Forest Experiment Station. Research Paper NE-537. 8pp)

Payload (2L) $=$ SW $*((0.28 * \cos (\theta)-\sin (\theta)) /(0.285 * \operatorname{con}(\theta)+\sin (\theta)))$
Where $2 \mathrm{~L}=$ weight of logs, or payload in pounds;
SW = skidder's weight in pounds;
$\theta=$ slope in radians.
Some Excel functions:
$=\operatorname{IF}(B 6>=100, B 6 * 0.10, B 6 * 0.05)$; Takes three arguments. The first is the logical test.
The second argument is the result that you want the function to display if the first argument is true. The third argument is the result if the first argument is false.
=ATAN(number); Returns the arctangent, or inverse tangent, of a number. The arctangent is the angle whose tangent is number. The returned angle is given in radians in the range $-\mathrm{pi} / 2$ to $\mathrm{pi} / 2$.
$=\mathrm{MIN}$ (range); Returns the smallest value in a data range.
$=$ SUM(range); Returns the sum of a data range.
=AVERAGE(range); Returns an average value of a data range.
Production machine hours (PMH); Scheduled machine hours (SMH).
In this lab we are going to explore factors that affect skidder productivity in ground based logging systems. More specifically, how terrain impacts skidder payload which in turn affects productivity. Below is a p-line survey for a skid road, the landing is located at station $0+00$.

Using the information in the survey and the payload equation that we derived for skidder payload and some Excel functions and formulas (Table 1) to develop an Excel sheet to answer the following questions:
A. What is the maximum payload for a skidder that weighs $23,485 \mathrm{lbs}$.?
B. Assuming that the maximum safe working payload is $95 \%$ of the maximum payload what is the maximum safe working payload?
C. What is the maximum payload for this skidder on a $12 \%$ adverse slope? (Work this calculation by hand and show all work)
D. What is the maximum payload that can be brought to the landing from Sta. 10+23?
E. Which section of the skid trail limits the maximum payload?
F. What is the maximum payload that can be brought to the landing from Sta. $4+00$ ?
G. Assuming a loaded speed of $12.6 \mathrm{ft} / \mathrm{sec}$ and an unloaded speed of $20 \mathrm{ft} / \mathrm{sec}$ and hook and unhook time of $100 \mathrm{sec} / t u r n$. If the skidder were to work at maximum capacity what would the average hourly production be for the entire skid trail in tons/hour? Assuming an hourly rate for a skidder of $\$ 145.77 / \mathrm{SMH}$, what cost would be needed at the landing to break even (Give answer in \$/ton).

The Excel worksheet can be downloaded at www.wdscapps.caf.wvu.edu/jxwang/courses/WDSC422/Labs/Lab2_SkidderPayload_Analysis.xlsx.

Please submit a summary report containing the answers to the above questions before the beginning of next lab. If you would like to be considered for partial credit, please consider to submit your calculations (in a neat and organized manner).

Table 1. Excel cell formulas in this assignment.

| Description | Cell Name | Formula |
| :---: | :---: | :---: |
| Slope | D3 | =IF(C3="",(C4-C2)/25,"") |
| Inverse slope | E3 | =IF(D3<>"",D3*-1,"") |
| Payload | F3 | $\begin{aligned} & \text { =IF(E3<>"",((0.28*COS(ATAN(E3))- } \\ & \text { SIN(ATAN(E3)))/(0.285*COS(ATAN(E3))+SIN(ATAN(E3))))*23485, } \\ & \text { "") } \end{aligned}$ |
| Payload to landing | G3 | =IF(F3<>"",IF(F3>21919.33,21919.33,MIN(\$F\$3:F3)),"") |
| Unloaded time | H3 | =IF(G3<>"",B4/20,"") |
| Loaded time | I3 | =IF(G3<>"",B4/12.6,"") |
| Hook and unhook time | J3 | =IF(G3<>"",100,"") |
| Total productive turn time (sec) | K3 | =IF(G3<>"",SUM(H3:J3),"") |
| Scheduled machine time per turn (sec) | L3 | =IF(G3<>"",K3/0.65,"") |
| Scheduled machine time per turn (hours) | M3 | =IF(G3<>"",L3/3600,"") |
| Skidding productivit y (tons/SMH) | N3 | =IF(G3<>"",(G3/2000)/M3,"") |
| Skidding hourly cost (\$/SMH) | O3 | =IF(G3<>"",147.77/N3,"") |
